BACKGROUND

With the rapid advancement of modern technology, digital platforms have simplified how people access products and services daily. However, in the event planning industry, connecting venue seekers with venue owners remains largely fragmented and inefficient. People looking for spaces to host events such as weddings, birthday parties, and corporate functions often face difficulties discovering suitable venues, checking real-time availability, and making reliable bookings. Similarly, venue owners struggle to reach a broader audience, streamline booking requests, and build trust through transparent customer feedback. To

bridge this gap, modern web and mobile applications offer centralized marketplace solutions that connect both parties seamlessly. A comprehensive venue management system involves three main stages:

- Discovery - Searching, filtering, and viewing detailed venue profiles, pricing, and availability.
- Booking - Securing the desired venue directly through an automated reservation process.
- Rating and Reviewing - Allowing clients to leave feedback and scores after their event to establish trust and quality assurance for future users.

STATEMENT OF THE PROBLEM

The process of discovering, booking, and reviewing event venues remains inefficient and manual. Event planners lack a centralized platform to check real-time availability and verified user feedback, while venue owners struggle with limited visibility and double-booking risks.
This project addresses these challenges by developing a unified web-based booking and rating system.

AIM OF THE PROJECT

To design and develop a centralized web-based venue management system that enables users to seamlessly search, book, and rate event spaces while providing venue owners with a streamlined platform to manage listings and reservations.

OBJECTIVES OF THE PROJECT

- To analyze and specify the core functional requirements for event planners and venue owners
- To design the database, system architecture, and user interface for venue listing, real
  -time booking, and post-event rating workflows.
- To implement a secure web platform integrating interactive venue discovery, booking management, post-event user reviews, and an AI-powered search recommendation feature.
- To test and evaluate the system to ensure smooth booking functionality, data security, and user satisfaction.

FEASIBILITY STUDY

- MARKET FEASIBILITY

  Market feasibility assesses whether there is a genuine demand for the proposed system and a receptive user base.

  1. Target Audience Demand: Event planners and individuals regularly

struggle with manual venue sourcing through scattered channels, while venue owners lack affordable digital marketing tools.

2. Market Need: The platform solves a clear gap in accessibility, price transparency, and verified social proof (reviews) for local event spaces.

3. Competitive Advantage: Unlike static social media pages or simple directory listings, this platform integrates real-time reservation management with post-event user verification in a single workflow.

● Technical Feasibility

Technical feasibility evaluates whether the system can be successfully built using available technologies and technical expertise..

1. Technology Stack: The platform can be developed using standard, well-documented web technologies (e.g., React/Vue or HTML/CSS/JS for the frontend; Node.js, Python, or PHP for the backend; PostgreSQL or MySQL for the relational database).

2. Core Functionalities: Standard database techniques easily handle availability calendars, booking queries, user authentication, and review score

3. Scalability & Maintenance: Cloud hosting platforms (such as AWS, Heroku, or Firebase) offer cost-effective, scalable infrastructure for deployment and database storage.

● Operational Feasibility

Operational feasibility analyzes how smoothly the platform will fit into users' everyday routines and whether they will adopt it easily.

1. User Adoption (Clients): The platform simplifies the booking process into a few clicks, offering a much faster and more transparent alternative to phone calls and site visits.

2. User Adoption (Venue Owners): A simple dashboard allows non-technical venue managers to update availability, view incoming requests, and respond to reviews without complex training.

3. Workflow Alignment: Automated notifications (email/SMS) ensure seamless communication between both parties during booking requests and post-event feedback.

●4. Economic/FinancialFeasibility

Economic feasibility examines the balance between development/operational costs and potential value or return.

1. Development & Setup Costs: Utilizing open-source frameworks, free-tier

developer tools, and standard hosting keeps initial capital expenditure low.

2. Operational Costs: Recurring costs are limited to domain maintenance, database hosting, and optional third-party API usage (e.g., payment gateways or SMS alerts).

3. Sustainability / Value: The system generates high operational efficiency and can sustain itself through optional monetization strategies (such as premium listings, transaction fees, or subscription tiers for venue owners).
